

# Python - String Methods

[< Previous](#)[Next >](#)

## String Methods

Python has a set of built-in methods that you can use on strings.

**Note:** All string methods return new values. They do not change the original string.

Method	Description
<a href="#"><u>capitalize()</u></a>	Converts the first character to upper case
<a href="#"><u>casefold()</u></a>	Converts string into lower case
<a href="#"><u>center()</u></a>	Returns a centered string
<a href="#"><u>count()</u></a>	Returns the number of times a specified value occurs in a string
<a href="#"><u>encode()</u></a>	Returns an encoded version of the string
<a href="#"><u>endswith()</u></a>	Returns true if the string ends with the specified value
<a href="#"><u>expandtabs()</u></a>	Sets the tab size of the string
<a href="#"><u>find()</u></a>	Searches the string for a specified value and returns the position of where it was found
<a href="#"><u>format()</u></a>	Formats specified values in a string

Dark mode

<u>index()</u>	Searches the string for a specified value and returns the position of where it was found
<u>isalnum()</u>	Returns True if all characters in the string are alphanumeric
<u>isalpha()</u>	Returns True if all characters in the string are in the alphabet
<u>isdecimal()</u>	Returns True if all characters in the string are decimals
<u>isdigit()</u>	Returns True if all characters in the string are digits
<u>isidentifier()</u>	Returns True if the string is an identifier
<u>islower()</u>	Returns True if all characters in the string are lower case
<u>isnumeric()</u>	Returns True if all characters in the string are numeric
<u>isprintable()</u>	Returns True if all characters in the string are printable
<u>isspace()</u>	Returns True if all characters in the string are whitespaces
<u>istitle()</u>	Returns True if the string follows the rules of a title
<u>isupper()</u>	Returns True if all characters in the string are upper case
<u>join()</u>	Joins the elements of an iterable to the end of the string
<u>ljust()</u>	Returns a left justified version of the string
<u>lower()</u>	Converts a string into lower case
<u>lstrip()</u>	Returns a left trim version of the string
<u>maketrans()</u>	Returns a translation table to be used in translations
<u>partition()</u>	Returns a tuple where the string is parted into three parts
<u>replace()</u>	Returns a string where a specified value is replaced with a specified value
<u>rfind()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rindex()</u>	Searches the string for a specified value and returns the last position of where it was found
<u>rjust()</u>	Returns a right justified version of the string
<u>rpartition()</u>	Returns a tuple where the string is parted into three

HTML

CSS

<u><a href="#">rstrip()</a></u>	Returns a right trim version of the string
<u><a href="#">split()</a></u>	Splits the string at the specified separator, and returns a list
<u><a href="#">splitlines()</a></u>	Splits the string at line breaks and returns a list
<u><a href="#">startswith()</a></u>	Returns true if the string starts with the specified value
<u><a href="#">strip()</a></u>	Returns a trimmed version of the string
<u><a href="#">swapcase()</a></u>	Swaps cases, lower case becomes upper case and vice versa
<u><a href="#">title()</a></u>	Converts the first character of each word to upper case
<u><a href="#">translate()</a></u>	Returns a translated string
<u><a href="#">upper()</a></u>	Converts a string into upper case
<u><a href="#">zfill()</a></u>	Fills the string with a specified number of 0 values at the beginning
